

In view of the foregoing, it is believed that this application is in condition for examination on the merits, and for allowance. Early notice of that effect is hereby solicited.

Respectfully submitted.

EPIGENESIS PHARMACEUTICALS, INC.

wherein B is adenosine, or, more preferably, replaces adenosine and is an “equivame\\lent” or a “universal”  
 base, and adenosine A<sub>2a</sub> receptor agonist or only minimally antagonist, an adenosine A<sub>2b</sub> receptor antagonist,  
 25 an adenosine A<sub>3</sub> receptor antagonist, or an adenosine A<sub>1</sub> receptor antagonist. Similarly, adenosine (A) may  
 always be replaced by an “alternative”, “equivalent” and/or “universal” base having a small fraction,  
 preferably less than 0.3 of the activity of adenosine at the adenosine receptor(s), as described above.

In one preferred embodiment, the links between neighboring mononucleotides are phosphodiester  
 links. In another preferred, at least one mononucleotide phosphodiester residue of the anti-sense  
 30 oligonucleotide(s) is substituted by a methylphosphonate, phosphotriester, phosphorothioate,  
 phosphorodithioate, boranophosphate, formacetal, thioformacetal, thioether, carbonate, carbamate, sulfate,  
 sulfonate, sulfamate, sulfonamide, sulfone, sulfite, sulfoxide, sulfide, hydroxylamine, 2'-O-methyl,  
 methylene(methylimino), methyleneoxy (methylimino), phosphoramidate residues, and combinations thereof.  
 The oligos having one or more phosphodiester residues substituted by one or more of the other residues are  
 35 generally longer lasting, given that these residues are more resistant to hydrolysis than the phosphodiester  
 residue. In some cases up to about 10%, about 30%, about 50%, about 75%, and even all phosphodiester  
 residues may be substituted (100%). Typically, the multiple target anti-sense oligonucleotide (oligo) of the  
 invention comprises at least about 7 mononucleotides, in some instances up to 60 and more mononucleotides,  
 preferably about 10 to about 36, and more preferably about 12 to about 21 mononucleotides. However, other  
 40 lengths are also suitable depending on the length of the target macromolecule. Examples of the MTA oligos of  
 the invention are provided in Table 3 below, which includes ninety-four sequences (SEQ ID NOS.: 2316  
 through 2410).

B: Universal Base

The MTA oligos of Table 3 are suitable for use with two or more of the targets listed in Table 4 below.
